

Project: “Travel Destinations”

To learn about NodeJs, SQL databases, and building a frontend with javascript/typescript, you will work on a domain of your own choice that follows the requirements. We can suggest a travel destinations domain, consider it a log of your previous visited vacation-locations.

The project should be built using the languages and techniques from the classes and is developed individually. You can discuss and get help from your classmates.

The project can be handed in as a .zip file or a link to eg. GitHub on 16th of October at 12:00.

Backend

We expect you to save relevant information about travel destinations in a database with eg. Title, Date (from and to), description, location, country.

- The backend should be developed using the subjects from our classes about NodeJs. The backend must be an API that sends data to the frontend using JSON.
- CRUD operations following REST principles for the travel destinations.
- The backend should have basic error handling eg. it should not be possible to save a travel destination without a title.

Frontend

The frontend should only use standard html, css and javascript/typescript.

- 1 page for creating a new travel destination, with multiple input fields corresponding to the desired data model, and validation you find suitable. We should have front-end validation where possible.
- 1 List view page, showing multiple/all travel destinations.
- 1 page for showing an existing travel destination (for updating).
- Login and signup - pages and functionality.
- The ability to login.
- The ability to update existing destinations .
- Use the same layout as creation, but with pre-filled information from the entity we want to edit.
- The ability to delete a destination .
- Only show the delete button for authorized/logged in users.
- Add a confirmation dialog for deletion.
- The Frontend should be able to dynamically update/sync the UI after deleting.
- i.e. No refreshes to update/reload the data.
